Problem:
College students have to manage assignments, exams, study schedules, gym sessions, classes, and personal time across multiple platforms. I want to solve spending too much or too little time on certain commitments and being able to keep track of everything to make sure you're in a good spot academically and outside of school.

Solution:
I'm going to build a Java-based student planner that tracks their daily schedule and can also send alerts to their devices like a phone if they are off track or not meeting any one task. The program will help users organize their time and stay on top of academic and personal goals.

Tech Stack:

Java (programming language)
Java Swing for the graphical user interface (GUI)
Java Collections Framework (ArrayList, HashMap, etc.) to store and manage tasks
Java Time API (LocalDate, LocalDateTime) for deadlines and scheduling
Java File I/O for reading and writing data files
JSON for storing user data (assignments, study sessions, gym schedules, and free-time activities)
Git for version control
GitHub for repository hosting and project management
VS Code as the development environment

Data Storage:
Local JSON files to save and load user schedules and task information.

External Data Sources:
None for the MVP; all data will be entered manually by the user. Future versions may integrate with Google Calendar or notification services APIs.

	Urgent	Not Urgent
Important	**Do - (Your MVP)** • •	**Schedule - (For V2.0+)** • •
Not Important	**Delegate - (Use a library)** • •	**Delete - (Cut it)** • • •
